Part 2: Work Out

Directions: Present your solutions in the space provided. Show all your work neatly and concisely and box your final answer. You will be graded not merely on the final answer, but also on the quality and correctness of the work leading up to it.

16. (12 pts) Evaluate $\int \frac{1}{x\sqrt{x^2+4}} dx$
- key: $-\frac{\sqrt{x^2+4}}{2} + C$
- Let $x = 2 \tan \theta \Rightarrow dx = 2 \sec^2 \theta d\theta$
- $$= \int \frac{1}{4 \tan^2 \theta \sqrt{4 \tan^2 \theta + 4}} \cdot 2 \sec^2 \theta d\theta$$
- $$= \int \frac{1}{4 \tan^2 \theta \cdot 2 \sec \theta} \cdot 2 \sec^2 \theta d\theta = \frac{1}{4} \int \frac{1}{\tan^2 \theta} \cdot \sec \theta d\theta$$
- $$= \frac{1}{4} \int \frac{\cos^2 \theta}{\sin^2 \theta} \cdot \frac{1}{\cos \theta} d\theta = \frac{1}{4} \int \frac{\cos \theta}{\sin^2 \theta} d\theta$$
- Let $u = \sin \theta \Rightarrow du = \cos \theta d\theta$
- $$= \frac{1}{4} \int \frac{1}{u^2} du = -\frac{1}{4u} + C = -\frac{1}{4 \sin \theta} + C$$
- And since $x = 2 \tan \theta \Rightarrow \tan \theta = \frac{x}{2}$
- $$\Rightarrow \sin \theta = \frac{x}{\sqrt{x^2+4}}$$
- $\therefore = -\frac{\sqrt{x^2+4}}{4x} + C$

17. (8 pts) Consider the following series
- $$\sum_{n=1}^{\infty} \frac{1-3^{n-1}}{3^n}$$
- (a) Determine whether the series converges or diverges, and state the reason.
(b) If it converges, find its sum. If it diverges, write DIVERGES.
- key: $-\frac{1}{2}$

$$\sum_{n=1}^{\infty} \frac{1-3^{n-1}}{3^n} = \sum_{n=1}^{\infty} \frac{1}{3^n} - \sum_{n=1}^{\infty} \frac{3^{n-1}}{3^n} = \sum_{n=1}^{\infty} \frac{1}{3^n} - \sum_{n=1}^{\infty} \frac{1}{3^n}$$

$$= \sum_{n=1}^{\infty} \left(\frac{1}{3} \right)^n - \sum_{n=1}^{\infty} \left(\frac{1}{3} \right)^n$$

Since $|r_1| = \frac{1}{3} < 1$ and $|r_2| = \frac{1}{3} < 1$ } answer for part (a)
the series converges.

And res sum is

$$= \frac{\frac{1}{3}}{1 - \frac{1}{3}} - \frac{1}{3} \cdot \frac{1}{1 - \frac{1}{3}}$$

$$= \frac{\frac{1}{3}}{\frac{2}{3}} - \frac{1}{3} \cdot \frac{3}{2} = \frac{1}{2} - \frac{1}{2} = 0$$

18. (12 pts) Evaluate $\int \frac{-2x+4}{(x^2+1)\sqrt{x+1}} dx$
- key: $-\frac{1}{2} \ln|x^2+1| + \arctan x + 3 \ln|x+1| + C$

$$\frac{-2x+4}{(x^2+1)(x+1)} = \frac{Ax+B}{x^2+1} + \frac{C}{x+1}$$

$$\Rightarrow -2x+4 = (Ax+B)(x+1) + C(x^2+1)$$

$x = -1$: $6 = 0 + C(2) \therefore C = 3$
 $x = 0$: $4 = B + 3 \therefore B = 1$
 $x = 1$: $2 = (A+1)(2) + 3(2) \Rightarrow -4 = (A+1)(2) \therefore A = -3$

Then

$$= \int \frac{-3x+1}{x^2+1} + \frac{3}{x+1} dx$$

$$= -3 \int \frac{x}{x^2+1} dx + \int \frac{1}{x^2+1} dx + 3 \int \frac{1}{x+1} dx$$

$$= -\frac{3}{2} \ln|x^2+1| + \arctan x + 3 \ln|x+1| + C$$

19. (8 pts) Use the Integral Test to determine whether $\sum_{n=2}^{\infty} \frac{1}{x(\ln x)^2}$ converges or diverges. Support your answer.
- key: $\int_2^{\infty} \frac{1}{x(\ln x)^2} dx = \frac{1}{2}$. Since the improper integral converges, so the series converges by the Integral Test.

Let $f(x) = \frac{1}{x(\ln x)^2}$: continuous, positive, and decreasing in $[2, \infty)$

Then the integral test:

$$\int_2^{\infty} \frac{1}{x(\ln x)^2} dx = \lim_{t \rightarrow \infty} \int_2^t \frac{1}{x(\ln x)^2} dx$$

Let $u = \ln x \Rightarrow du = \frac{1}{x} dx$

$$= \lim_{t \rightarrow \infty} \int_{\ln 2}^{\ln t} \frac{1}{u^2} du$$

$$= \lim_{t \rightarrow \infty} \left[-\frac{1}{u} \right]_{\ln 2}^{\ln t}$$

$$= \lim_{t \rightarrow \infty} \left[-\frac{1}{\ln t} + \frac{1}{\ln 2} \right]$$

$$= \frac{1}{\ln 2}$$
 : converges

Since the improper integral converges, so the series converges by the Integral Test.
